# User-defined functions

INTRODUCTION TO FUNCTIONS IN PYTHON

Hugo Bowne-Anderson
Instructor

#### What you will learn:

- Define functions without parameters
- Define functions with one parameter
- Define functions that return a value
- Later: multiple arguments, multiple return values

#### **Built-in functions**

• str()

```
x = str(5)
print(x)
151
print(type(x))
<class 'str'>
```

#### Defining a function

```
def square(): # <- Function header
  new_value = 4 ** 2 # <- Function body
  print(new_value)
square()</pre>
```

16

#### **Function parameters**

```
def square(value):
    new_value = value ** 2
    print(new_value)
square(4)
16
square(5)
25
```

#### Return values from functions

• Return a value from a function using return

```
def square(value):
    new_value = value ** 2
    return new_value
num = square(4)
print(num)
```

16

#### Docstrings

- Docstrings describe what your function does
- Serve as documentation for your function
- Placed in the immediate line after the function header
- In between triple double quotes """

```
def square(value):
    """Returns the square of a value."""
    new_value = value ** 2
    return new_value
```

## Let's practice!

INTRODUCTION TO FUNCTIONS IN PYTHON

# Multiple Parameters and Return Values

INTRODUCTION TO FUNCTIONS IN PYTHON

Hugo Bowne-Anderson Instructor

#### Multiple function parameters

Accept more than 1 parameter:

```
def raise_to_power(value1, value2):
    """Raise value1 to the power of value2."""
    new_value = value1 ** value2
    return new_value
```

• Call function: # of arguments = # of parameters

```
result = raise_to_power(2, 3)
print(result)
```

8

#### A quick jump into tuples

- Make functions return multiple values: Tuples!
- Tuples:
  - Like a list can contain multiple values
  - Immutable can't modify values!
  - Constructed using parentheses ()

```
even_nums = (2, 4, 6)
print(type(even_nums))
```

```
<class 'tuple'>
```

#### Unpacking tuples

Unpack a tuple into several variables:

```
even_nums = (2, 4, 6)

a, b, c = even_nums
```

```
print(a)
print(b)
print(c)
```

#### Accessing tuple elements

 Access tuple elements like you do with lists:

```
even_nums = (2, 4, 6)
print(even_nums[1])
```

```
second_num = even_nums[1]
print(second_num)
```

4

• Uses
4

Uses zero-indexing

#### Returning multiple values

```
def raise_both(value1, value2):
    """Raise value1 to the power of value2
    and vice versa."""
    new_value1 = value1 ** value2
    new_value2 = value2 ** value1
    new_tuple = (new_value1, new_value2)
    return new_tuple
result = raise_both(2, 3)
print(result)
(8, 9)
```

## Let's practice!

INTRODUCTION TO FUNCTIONS IN PYTHON

# Bringing it all together

INTRODUCTION TO FUNCTIONS IN PYTHON

Hugo Bowne-Anderson
Instructor

#### What you have learned:

- How to write functions
  - Accept multiple parameters
  - Return multiple values
- Up next: Functions for analyzing Twitter data

#### Basic ingredients of a function

Function Header

```
def raise_both(value1, value2):
```

Function body

```
"""Raise value1 to the power of value2
and vice versa."""

new_value1 = value1 ** value2
new_value2 = value2 ** value1

new_tuple = (new_value1, new_value2)

return new_tuple
```
